the bible uses the heart to represent the whole inner person the part of a person that receives a new body as he she moves from life on earth into the rest of eternity because the heart is the key to each person's eternal good our loving god makes purifying our hearts a priority he gives true progress but he also wants each of his children in jesus to co operate with his work for our good this allows major problems a heart often has unhealed wounds wrong beliefs and distracting treasures the heart naturally protects itself against getting changed even by deceiving one's own mind if necessary and the devil and

demons try diligently to deceive people out of receiving god's great good in Jesus. This book is written to show biblical solutions for these kinds of heart problems.

Biblically, the heart is the source of a person's behaviors, beliefs, thoughts, attitudes, desires, motives, and values. The heart is so important to who we are, our inner nature, that is given a new body for our eternity in Jesus. God made the heart naturally stable by making it greatly fear getting changed. This is good but also causes the heart to be very self-deceptive if it needs to be cleaned. How can we proceed? This book shows the biblical picture of the heart more fully so that we can see ways for believers in Jesus to work with him to clean our deceiving hearts for our eternity and for our close life-giving fellowship with God on earth. I gave two related books the same cover so that readers can choose the best fit: *Purifying the Heart* puts solutions of heart problems with their discussion; this complicates the picture of the heart; *Destroying Spiritual Strongholds* more fully explains this picture from the Bible, which is a harder introduction to this picture.

Computational Geomechanics, the new edition of the first book to cover the computational dynamic aspects of geomechanics, now including more practical applications and up-to-date coverage of current research in the field, advances in computational geomechanics have dramatically improved understanding of the behavior of soils and the ability of engineers to design increasingly sophisticated constructions in the ground. When Professor Olek Zienkiewicz began the application of numerical approaches to solid dynamics at Swansea University, it became evident that realistic prediction of the behavior of soil masses could only be achieved if the total stress approaches were abandoned. *Computational Geomechanics* introduces the theory and application of Zienkiewicz's computational approaches that remain the basis for work in the area of saturated and unsaturated soil to this day. Written by past students and colleagues of Professor Zienkiewicz, this extended second edition provides formulations for a broader range of problems, including failure load under static loading, saturated and unsaturated consolidation, hydraulic fracturing, and liquefaction of soil under earthquake loading. The internationally recognized team of authors incorporates current computer technologies and new developments in the field, particularly in the area of partial saturation, as they guide readers on how to properly apply the formulation in their work. This one-of-a-kind volume explains the Biot-Zienkiewicz formulation for saturated and unsaturated soil, covers multiple applications to static and dynamic problems for saturated and unsaturated soil in areas such as earthquake engineering and fracturing of soils and rocks, features a completely new chapter on fast catastrophic landslides using depth-integrated equations, and smoothed particle hydrodynamics with applications. It presents the theory of porous media in the saturated and unsaturated states to establish the foundation of the problem of soil mechanics, provides a quantitative description of soil behavior, including simple plasticity models, generalized plasticity, and critical state soil mechanics. It includes numerous questions, problems, hands-on experiments, applications to other situations, and example code for *gehomadrid*. *Computational Geomechanics: Theory and Applications*, second edition, is an ideal textbook for specialist and general geotechnical postgraduate courses and a

must have reference for researchers in geomechanics and geotechnical engineering for software developers and users of geotechnical finite element software and for geotechnical analysts and engineers making use of the numerical results obtained from the biot zienkiewicz formulation
